VELMONT UNIVERSITY

Academic and degree planning

Planning information - not an approved catalog or institutional policy.

Proposed university in development. Planned first enrollment: Fall 2029, subject to required approvals and launch readiness. Admissions are not currently open.

Transfer Credit and Prior Learning

Previous study can be an important part of your next degree plan. Velmont's proposed evaluation process would review eligible university coursework and documented prior learning against the requirements of your chosen program. An official evaluation would explain which credits apply and what remains to complete.

What previous learning can mean

Eligible evidence and assessment methods will be defined in university policy. Credit would be awarded for demonstrated learning that meets academic requirements; time spent in employment alone does not establish academic credit.

Previous coursework

Prior university study and relevant course records may be considered for alignment with a future program.

Certifications and examinations

Relevant certifications and recognized examinations may provide evidence for evaluation, where policy allows.

Military learning

Recognized military learning may be considered where applicable and supported by the future policy.

Professional experience

Assessed learning demonstrated through professional experience may be considered. Years worked alone do not establish academic credit.

The proposed evaluation journey

Choose your degree

Evaluation is specific to program requirements.

Review evidence requirements

Approved guidance will identify records, assessment methods, fees and the secure submission route.

Receive an academic evaluation

Reviewers would explain accepted credits, their application to major, general education or elective requirements, and outstanding study.

Review your semester plan

An advisor would help connect the evaluation with prerequisites, course availability, financial planning and the bachelor's internship requirement.

Request a review where appropriate

Decision notices would explain the approved reconsideration or appeal route.

Standard and individual completion planning

Your plan will reflect semester terms and the credits that satisfy your chosen degree's requirements. Accepted credit may reduce remaining study, but the effect on duration and tuition depends on academic evaluation, course sequencing and the final billing policy. Bachelor's students must also complete the program's internship requirement unless an approved policy states otherwise. No automatic credit award or saving is promised.

What is not finalized

Credit limits, residency, grades, recency, duplicate learning, approved assessments, fees, timing, appeals and application to internship requirements remain to be decided. Flexible or accelerated routes and stackable credentials remain proposals.

Support from your first questions through degree completion.

Velmont's planned student-success approach connects preparation, degree planning, progress reviews and access to support. It also provides a framework for students who need to pause and later return to their studies.

Before you enroll

Explore your goals, previous study and program options. Pre-enrollment guidance would help identify potential barriers and support needs, explain the proposed credit-evaluation process and clarify the pathway you are considering.

Registration and planning

Develop an individual degree plan that reflects accepted credit, prerequisites, semester scheduling and remaining requirements. Bachelor's plans include the required internship. Financial guidance would help you understand tuition, other expenses and established payment options.

Early progress and advisor outreach

Velmont plans to review academic progress and engagement so advisors can offer timely guidance when additional support may be useful. Students would also be able to ask for help directly. Monitoring tools and outreach procedures are being developed.

Connect with support

Academic assistance, financial guidance, career advising and student-engagement opportunities would help students address questions and plan next steps. Advisors could also help identify relevant outside resources when needs extend beyond university services.

Planning a break

If circumstances interrupt your studies, discuss your options before changing enrollment. Guidance would explain academic and financial implications, how your progress is recorded and the steps for a possible return. Leave and re-entry policies are being developed.

Returning to study

Review your previous progress, current program requirements and any changes affecting your degree. The proposed re-entry process would update your academic plan and reconnect you with advising and other support as you resume study.

Service details and policies

Service details and policies will be published as arrangements are finalized. A previous credit award does not establish that requirements will remain unchanged indefinitely.

How Learning Works

Velmont plans to deliver online instruction through semester terms. The proposed experience connects academic foundations, applied projects, faculty guidance and responsible technology use. Every bachelor's degree includes a required internship at a partner site.

A clearer path through learning

Learn through applied work

Applied work, assessments and faculty feedback are intended to connect academic foundations with practical problems. Details will be published as academic preparation progresses.

Study within semester terms

Courses will be organized within semester terms. Program information will explain course sequencing, workload, assessment, instructor interaction and any scheduled attendance requirements as these are finalized. Semester terms do not mean courses are self-paced.

Practical experience

Applied assignments will connect concepts with field-relevant problems. Every bachelor's degree also requires an internship at a partner site.

Recognize demonstrated learning

Previous coursework and assessed prior learning may inform an individual study plan. Evidence, usable credit and decisions will require approved academic policies and appropriate human review.

Plan with support.

Individual degree planning would connect accepted credit, semester scheduling, financial considerations and support needs. Progress reviews and advisor outreach are part of the proposed approach to persistence and completion.

AI-integrated, human-accountable learning

AI may support faculty, students and services, but academic responsibility remains human. The proposed model emphasizes responsible use, privacy safeguards and clear review routes.

Improve an operating process

Analyze evidence, test options and communicate a reasoned recommendation.

Evaluate an AI application

Consider usefulness, reliability, privacy and security-not just model output.

Improve information exchange

Use synthetic health records to map a workflow, evaluate information quality and propose a secure exchange or reporting improvement.

- Human academic responsibility and oversight

- Responsible use and clear assessment expectations

- Privacy safeguards and review routes

- Synthetic or properly authorized data in healthcare demonstrations

Illustrative learning activities

Examples illustrate intended learning activities and do not represent approved course requirements.

Current availability

This website previews Velmont's planned academic experience. Ask Velmont is a Botpress AI Agent demonstration and does not provide official admissions, credit or financial decisions. Teaching platforms and staffed services will become available only as institutional readiness permits.

Planned degree portfolio

B.S. in Artificial Intelligence Systems and Machine Learning

Build the foundations to develop, evaluate and responsibly apply intelligent systems. The planned program connects programming and quantitative reasoning with AI applications, model evaluation and human oversight.

120 credits; $45,000 planned tuition; semester terms; online instruction with required internship. Tuition excludes required fees and other expenses. Completion duration will be published when finalized.

Applied AI & Intelligent Automation

Develop AI applications, conversational interfaces and automated workflows, with attention to integration testing, security and human review.

Machine Learning Engineering & Operations

Develop reproducible model pipelines and explore deployment, monitoring, drift detection and controlled updates.

AI application developer; automation developer; junior AI implementation specialist. Machine learning engineering roles may require additional technical experience.

B.S. in Data Science and Analytics

Learn to prepare, analyze and interpret data for informed decisions. The planned program combines programming, statistics, visualization and data pipelines with responsible data handling.

120 credits; $45,000 planned tuition; semester terms; online instruction with required internship. Tuition excludes required fees and other expenses. Completion duration will be published when finalized.

Big Data & Data Engineering

Build and evaluate data pipelines and cloud data platforms, including integration, quality controls, metadata and governance.

Statistical Modeling & Predictive Analytics

Apply statistical inference, forecasting, experimentation and model validation to evidence-based questions.

Data analyst; junior data engineer; junior data scientist, depending on demonstrated skills and employer requirements.

B.S. in Cybersecurity

Develop the foundations to protect digital systems and support security response. The planned program combines computing and security principles with controlled exercises, incident analysis and professional responsibility.

120 credits; $45,000 planned tuition; semester terms; online instruction with required internship. Tuition excludes required fees and other expenses. Completion duration will be published when finalized.

Cloud & Application Security

Explore secure infrastructure, software and identities through threat modeling, testing, vulnerability management and access controls.

Cyber Defense & Digital Forensics

Practice attack detection, incident investigation, evidence preservation and recovery in controlled environments.

Security operations analyst; junior security analyst; digital forensics support specialist. Some roles require certifications or additional experience.

M.S. in Applied Artificial Intelligence and Intelligent Systems

Develop advanced capability to design, evaluate and integrate AI systems responsibly. The planned program connects machine learning with AI engineering, reproducibility, deployment and governance.

36 credits; $20,000 planned tuition; semester terms; online instruction. Tuition excludes required fees and other expenses. Completion duration will be published when finalized.

Applied AI engineer; AI solutions specialist; AI evaluation specialist. Role suitability depends on prior preparation, experience and project evidence.

B.S. in Business Analytics

Use business knowledge and analytical methods to understand performance and support better decisions. The planned program connects business foundations with visualization, analytical reasoning and responsible AI literacy.

120 credits; $45,000 planned tuition; semester terms; online instruction with required internship. Tuition excludes required fees and other expenses. Completion duration will be published when finalized.

Business Intelligence & Commercial Analytics

Analyze customer, market, pricing and performance information through experimentation, forecasting and business communication.

Operations & Supply Chain Analytics

Explore demand, inventory, procurement, logistics and process improvement through forecasting, optimization and risk analysis.

Business intelligence analyst; operations analyst; commercial analyst; supply chain analyst.

B.S. in Financial Technology

Explore how data and digital systems shape financial services. The planned program connects finance foundations with digital payments, analytics, risk and responsible innovation.

120 credits; $45,000 planned tuition; semester terms; online instruction with required internship. Tuition excludes required fees and other expenses. Completion duration will be published when finalized.

Digital Banking & Payments

Examine payment flows, banking platforms, APIs, reconciliation, transaction controls and implementation testing.

Financial Risk & Fraud Analytics

Explore credit, fraud and financial-crime risks through statistical models, monitoring, investigations and model evaluation.

Payments analyst; fraud analyst; financial technology operations analyst. Regulated roles may have additional requirements.

B.S. in Health Informatics

Connect health information with digital systems and organizational decisions. The planned nonclinical program combines health-system context, information management, analytics, privacy and interoperability.

120 credits; $45,000 planned tuition; semester terms; online instruction with required internship. Tuition excludes required fees and other expenses. Completion duration will be published when finalized.

Healthcare Analytics & Population Health

Analyze utilization, quality, outcomes, costs and population patterns while examining privacy, bias and service improvement.

Health Information Systems & Interoperability

Explore health information workflows, data exchange, HL7/FHIR interfaces, access controls, information quality and user training.

Healthcare data analyst; health systems analyst; health technology implementation support specialist. This is a nonclinical program; it does not confer clinical licensure.

M.S. in Business Analytics

Translate complex business evidence into decisions that can be explained and evaluated. The planned program integrates advanced analytics, AI-supported analysis and organizational context.

36 credits; $20,000 planned tuition; semester terms; online instruction. Tuition excludes required fees and other expenses. Completion duration will be published when finalized.

Business analytics specialist; decision analyst; analytics consultant. Leadership roles typically require relevant professional experience.

Planned for Fall 2029, subject to required approvals and launch readiness. Admissions are not currently open. Career examples describe possible directions and do not guarantee employment, salary or certification eligibility.
